No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                     rectifying potassium channel. Channel properties are modulated by cAMP and subunit assembly. Mediates the rapidly activating component of the delayed rectifying potassium current in heart (IKr) (By similarity).

-!- SUBUNIT: The potassium channel is probably composed of a homo- or heterotetrameric complex of pore-forming alpha subunits that can associate with modulating beta subunits. Heteromitimer with KCNHF/ERG2, KCNHY/ERG3, KCNHZ and KCNE2 (By similarity).
-!- SUBCELLULAR LOCATION: Integral membrane protein.
-!- TISSUE SPECIFICITY: Highly expressed in heart and brain.
-!- DOMAIN: The segment S4 is probably the voltage-sensor and is characterized by a series of positively charged amino acids at every third position.
-!- SIMILARITY: Belongs to the potassium channel family. H (Eag)
                                                                                                                                                                                                                                                                                               "Tissue and species distribution of mRNA for the IKr-like K+ channel

-1-5UNCTION: Produced by lymphocytes activated by specific antigens or mitogens. IRP gamma, in addition to having antiviral activity, has important immunoregulatory functions. It is a potent activator of macrophages, it has antiproliferative effects on transformed cells and it can potentiate the antiviral and antitumor effects of the type I interferons (By similarity).
                                                                                                                                                                                                                                                                                                                             -i- SUBCELLULAR LOCATION: Secreted.
-i- TISSUE SPECIFICITY: Released primarily from activated T lymphocytes (By similarity).
-i- SIMILARITY: Belongs to the type II (or gamma) interferon family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

-1- FUNCTION: Produced by lymphocytes activated by specific antigens or intogens. IRN-gamma, in addition to having antiviral activity, has important immunorequiatory functions. It is a potent activity of macrophages, it has antiproliferative effects on transformed cells and it can potentiate the antiviral and antitumor effects of the type I interferons.

-1- SUBUNIT: Homodimer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                lymphocytes.
-!- SIMILARITY: Belongs to the type II (or gamma) interferon family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Yaba monkey tumor virus.

-!- FUNCTION: May be involved in the formation of a specific microcompartiment in the cell in which the metabolism of potentially toxic by-products takes place.
-!- PATHWAY: Ethanolamine utilization.
-!- SIMILARITY: DISTANTLY RELATED TO THE CCHA/CCMK/CSOSI/PDUA FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

Bacteriol. 185:2330-2337(2003).

-I- FUNCTION: May be involved in the formation of a specific microcompartiment in the cell in which the metabolism of potentially toxic by-products takes place.

-I- PATHWAY: Ethanolamine utilization.

-I- SIMILARITY: DISTANTLY RELATED TO THE CCHA/CCMK/CSOS1/PDUA FAMILY.
Bacteria; Proteobacteria; Gammaproteobacteria; Enterobacteriales;
Enterobacteriaceae; Salmonella.
NCBI_TaxID=602, 601;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
Matsui H., Kawahara K., Terakado N., Danbara H.;
"Nuclocide sequence of a gene encoding a 29 kDa polypeptide in mba
"region of the virulence plasmid, pKDSC50, of Salmonella
choleraesuis.";
                                                                                                                                    Nucleic Acids Res. 18:1055-1055(1990).
-!- FUNCTION: NOT KNOWN. THIS PROTEIN IS INVOLVED IN THE VIRULENCE OF SALMONELLAS.
-!- SIMILARITY: TO SIMILAR PROTEIN IN OTHER SALMONELLA VIRULENCE PLASMIDS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    "Nucleotide sequence of mkaD, a virulence-associated gene of Salmonella typhimurium containing variable and constant regions."; Gene 93:147-150(1990).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Plasmid pSLT, Plasmid pEX102, Plasmid pSDL2, and Plasmid pNL2001.

Fan H, Song X, Bariola PA, Linderoth NA,

Wei Z;

New isolated protein as a receptor in plants for plant pathogen hypersensitive response elicitors, useful for identifying agents that impart disease resistance, enhance plant growth, control insects and/or impart stress tolerance.

Claim 12; Page 56; 104pp; English.

The present invention describes an isolated protein (I) serving as a receptor in plants for plant pathogen hypersensitive response elicitors. Also described: (1) an isolated nucleic acid encoding (I); (2) an antisense nucleic acid molecule to the nucleic acid of (1); (3) an expression vector containing the nucleic acid of (1); (3) an nucleic acid of (1) a transgenic host cell transformed with the nucleic acid of (1) or the DNA molecule of (2); (5) a transgenic plant transformed with the nucleic acid of (1) or the DNA molecule of (2); (6) identifying agents targeting plant cells, comprising forming a reaction mixture having (I) or the host cell of (4) and a candidate agent,

```
produced by the host cell and the candidate agent, and identifying candidate compounds which bind to the proteins in the reaction mixture as plant cell targeting agents; (7) enhancing plant receptivity to treatment with hypersensitive response elicitors, comprising providing a transgenic plant or plant seed transformed with the nucleic acid of (1); and (8) and/or imparting stress resistance, enhancing growth, controlling insects, and/or imparting stress resistance to plants, comprising providing a transgenic plant or plant seed transformed with a DNA construct effective transgenic plant or plant seed transformed with a DNA construct effective transgenic plant or plant seed transformed with a DNA construct effective the invention are useful for identifying agents targeting plant cells to enhance a plant's receptivity to treatment with a hypersensitive response elicitor. The hypersensitive response elicitor treatment includes imparting stress released the present sequence represents and and and a mandial and sease resistance, the present sequence represents and and a mandial and a mandial plant growth, controlling insects and a mandial and a mandial plant sease and a mandial 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        /note= "Linked to Xa-Y1; Where Xa is independently a direct bond or a peptidic structure comprising from about 1-25 amino acid residues and Y1 is hydrogen, alkyl or acy1"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            /note= "Linked to Xb-Y2; Where Xb is independently a direct bond or a peptidic structure comprising from about 1-25 amino acid residues and Y2 is -OH, amino or monosubstituted or disubstituted amino"

                                New peptide modulators of androgen receptor, useful for treating androgen -associated disorder, e.g. prostate cancer, particularly hormonally refractive prostate cancer, colon cancer, lung cancer, acne, or
                                                                                                                                                     The present invention relates to novel peptide modulators of androgen receptor. The peptides of the invention are useful for treating androgen-ssociated disorders such as prostate cancer, particularly hormonally refractive prostate cancer, colon cancer, lung cancer, benign prostatic hypertrophy, acne, hirsutism, male pattern baldness, Stein-Leventhal syndrome, androgen insensitivity syndrome, infertility, endometrial cancer and X-linked spinal bulbar muscular atrophy. The present sequence is an androgen receptor binding peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 peptide; supermotif; HLA molecule; CTL response; therapeutic; cancer; viral infection; hepatitis B; hepatitis C.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The sequences given in AAR89362-82 are immunogenic peptides which were used in the composition of the invention. The composition comprises an immunogenic peptide of 9-10 residues with a supermotif which allows binding of more than one HLA molecule. It pref. comprises two conserved residues, a first at the 2nd position from the N· terminal is pro, and a 2nd at the C-terminal is Met. These peptides are used to induce a CTL response in a patient. They are also useful in compositions for in vivo
                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                      ;

The invention relates to a method for identifying a binding molecule having selective affinity for a ligand comprising: (a) selectively immobilising a diverse population of binding molecules to a solid support; (b) simultaneously contacting the diverse population immobilised on the solid support with 2 or more ligands; and (c) determining at least one binding molecule which selectively binds to one or more of the ligands. The method allows for the rapid and efficient methods for the identification of binding molecules which exhibit selective affinity for one or more ligands of interest. They are used particularly for identifying tumour-specific binding polypeptides which can be used as targeting agents for cancer therapy that minimises impact on non-tumour tissues
and ex vivo therapeutic and diagnostic applications, e.g the treatment of cancer and viral infections, e.g. hepatitis B and \sf C
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This sequence represents a light chain complementarity determining region
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Identifying binding molecules for ligands, particularly tumour antigens -
by selectively immobilising a population of binding molecules to a solid
support and screening for binding to two or more ligands.

                                                                                                                                                                                                     The present invention describes an isolated prepared human papillomavirus (HPV) epitope (I). (I) has antiviral activity, and can be used in vaccine production. Peptides and corresponding nucleic acid compositions from the production. Peptides and corresponding nucleic acid compositions from the present invention are useful for stimulating an immune response to HPV by stimulating the production of CTL or HTL responses, specifically in the treatment or prophylaxis of HPV infection, in persons who have not manifested symptoms e.g. genital warts or neoplastic growth. The peptides can also be used in a terramer staining assay to assess peripheral blood monounclear cells for the presence of antigen-specific CTLs following exposure to a pathogen or immunogen, and as reagents to evaluate immune recall responses or evaluate the efficacy of a vaccine. The vaccine compositions are useful for removing warts or treating HPV infections. The epitopes for inclusion in an epitope-base vaccine may be selected
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   from conserved regions of viral or tumour-associated antigens, which the most conserved regions of viral or tumour-associated antigens, which that may be present in whole antigens can be avoided with the use of epitopse-base vaccines. An additional advantage is the ability to combine selected epitopes (CTL and HTL) and to modify the composition of the vaccine is that is safe and efficacious. AAB98331 to AAB98477 represent polypeptide sequences used in the exemplification of the present

The present invention describes an isolated prepared numan paptilionary true present invention describes an isolated prepared numan paptilionary production. Peptides and corresponding nucleic acid compositions from the production are useful for stimulating an immune response to HPV by estimulating the production of CTL or HTL responses, specifically in the treatment or prophylaxis of HPV infection, in persons who have not manifested symptoms e.g. genital warts or neoplastic growth. The peptides can also be used in a terramer staining assay to assess peripheral blood mononuclear cells for the presence of antigen-specific CTLs following exposure to a pathogen or immunogen, and as reagents to evaluate immune compositions are useful for removing warts or treating HPV infections. The epitopes for inclusion in an epitope-base vaccine may be selected from conserved regions of viral or tumour-associated antigens, which reduces the likelihood of escape mutants, also immunosuppressive epitopes (That may be present in whole antigens can be avoided with the use of epitope-base vaccines. An additional advantage is the ability to combine selected epitopes (CTL and HTL) and to modify the composition of the epitopes achieving enhanced immunogenicity, the major benefit of the vaccine is that is safe and efficacious. The present invention describes an isolated prepared human papillomavirus (HPV) epitope (I). (I) has antiviral activity, and can be used in vaccine production. Peptides and corresponding nucleic acid compositions from the present invention are useful for stimulating an immune response to HPV by cimulating the production of CTL or HTL responses, specifically in the treatment or prophylaxis of HPV infection, in persons who have not manifested symptoms e.g. genital warts or neoplastic growth. The peptides can also be used in a terramer staining assay to assess peripheral blood connonuclear cells for the presence of antigen. Specific CTLs following exposure to a pathogen or immunogen, and as reagents to evaluate immune reall responses or evaluate the efficacy of a vaccine. The vaccine compositions are useful for removing warts or treating HPV infections. The epitopes for inclusion in an epitope-asse vaccine may be selected from conserved regions of viral or tumour-associated antigens, which that may be present in whole antigens can be avoided with the use of epitopes (CTL and HTL) and to modify the composition of the epitopes achieving enhanced immunogenicity, the major benefit of the epitopes achieving enhanced immunogenicity, the major benefit of the vaccine is that is safe and efficacious. (1) has antiviral activity, and can be used in vaccine production. Peptides and corresponding nucleic acid compositions the production. Peptides and corresponding nucleic acid compositions the present invention are useful for stimulating an immune response to HPV by stimulating the production of CTL or HTL responses, specifically in the treatment or prophylaxis of HPV infection, in persons who have not manifested symptoms e.g. genital warts or neoplastic growth. The peptides can also be used in a tetramer staining assay to assess peripheral blood monounclear cells for the presence of antigen-specific CTLs following exposure to a pathogen or immunogen, and as reagents to evaluate immune recall responses or evaluate the efficacy of a vaccine. The vaccine compositions are useful for removing warts or treating HPV infections. The epitopes for inclusion in an epitope-base vaccine may be selected
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    from conserved regions of viral or tumour associated antigens, which that may be present in which that may be present in whole antigens can be avoided with the use of epitope-base vaccines. An additional advantage is the ability to combine selected epitopes (CTL and HTL) and to modify the composition of the vaccine is that is safe and efficacious. AAB98391 to AAB9847, represent polypeptide sequences used in the exemplification of the present

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention describes MAGE2/3 epitopes (I). Also described are: (1) a clonal cytotoxic T lymphocyte (CTL) that is cultured in vivo and binds to a complex of (I); (2) a peptide (II) comprising (I) and a second epitope and has less than 50 contiguous amino acids; (3) a vaccine composition comprising (II), a unit dose of a peptide with at least 50 contiguous amino acids with 100% identity to the native peptide sequence of MAGE2/3, and a pharmaceutical excipient; (4) an isolated nucleic acid encoding (I); and (5) an isolated nucleic acid encoding (II). (I) has cytostatic activity, and can be used in vaccines and as an immunostimulant. A vaccine of (3) is useful for the treatment and prevention of cancer. (I) is useful for monitoring or evaluating an

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               immune response by incubating a T-lymphocyte sample from a patient with (I) that binds to an human leukocyte antigen (HLA) allele present in the patient and detecting the presence of the T-lymphocyte that binds to the peptide. The vaccine allows the opportunity to combine epitopes derived from multiple tumour-associated molecules reducing the likelihood of tumour escape due to antigen loss. AAG84515 to AAG84909 and AAB99725 represent amino acid sequences used in the exemplification of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Prostate cancer-associated antigen; supermotif; human leukocyte antigen; HLA; cytotoxic T lymphocyte; helper T lymphocyte; HLA superfamily; CTL; immunogenicity; immunosuppression; HTL.
                                                                                                                                                                                                                                                                                                                                                                                                          An isolated prepared MAGE2/3 epitope (I) for use in pharmaceuticals for the treatment and prevention of cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human Leukocyte Antigen (HLA) Class I standard supermotif peptide #9.

The sequences represent prostate cancer-associated antigens and derived motif or supermotif epitopes. The peptide epitopes are included in prostate cancer vaccine compositions due to their ability to bind to human leukcorte antigen (HiA) molecules, which recognise the motifs.

Peptides with a high binding affinity are further tested for their ability to induce a cytotoxic T lymphocyte (CTL) or a helper T lymphocyte (HTL) response. Supermotif-bearing peptides may also be tested for their vaccine compositions can be modified, for example, to enhance immunogenicity, to avoid the inclusion of immunosuppressive groups, or to alter the immune response to suit the target disease. These group-based antigens from the same pathogen. Variability among the immune responses of patients can therefore be alleviated by the inclusion of groups from

The present invention describes isolated prepared HER2/neu epitopes (I).

Also described are: (1) a clonal cytotoxic T lymphocyte (CTL) that is

Culture in vitro and binds to a complex of an epitope (I), bound to a

human leukocyte antigen (HLA) molecule; (2) a peptide (II) comprising (I)

and a second epitope and the peptide is less than 50 contiguous amino

acids that have 100% identity with a native peptide sequence of HERZ/neu;

(3) a vaccine composition (III) comprising (II) and a pharmaceutical

compleximulant activities, and can be used in vaccines of HERZ/neu;

(III) are useful for inducing cellular immune responses for the

prevention and treatment of cancer. (I) and (II) are useful for

(III) are useful for inducing cellular immune response for the

prevention and treatment of cancer. (I) and (II) are useful for

(III) are useful for inducing cellular immune response to a tumour-associated

antigen when incubated with a T lymphocyte sample form a patient and

detecting the presence of bound T lymphocyte to (I) or (III). Epitope

compleximulant inmunosuppressive epitopes that may be present

in whole entigens may be avoided. Selected epitopes may be combined to

compleximate the ability. The possible pathological side effects caused by

infectious agents or whole protein antigen is eliminated. The vaccine

nvention
The present invention describes a composition (I) comprising a prepared human immunodeficiency virus-1 (HIV-1) group comprising an amino acid sequence selected from 51 defined amino acid sequences (ABL2347 to ABR25397). (I) has virucide activity and can be used in vaccines. (I) may be used for immunising subjects against HIV-1 infections. The use of group-based vaccines has several advantages over traditional vaccines, particularly when compared to the use of whole antigens in vaccines, cantigens is directed largely toward variable response to whole antigens is directed largely toward variable regions of the antigen, allowing for immune escape due to mutations. The groups for inclusion in an group-based vaccine may be selected from conserved regions of viral or tumour-associated antigens, which therefore reduces the likelihood of escape mutants. Furthermore, immunosuppressive groups that may be present in whole antigens can be avoided with the use of group-based vaccines. An additional advantage of an group-based vaccine approach is the ability to composition of the groups. achieving, for example, enhanced immunospation of the groups. achieving, for example, enhanced immunospatice, for the target disease. Similar engineering of the response is not possible with traditional approaches. ABP11501 to ABP25412.
                                                                                                                                                                                                                                         Vaccine compositions comprising human immunodeficiency virus-1 (HIV-1) peptide groups, useful for vaccinating against HIV-1.
                                                                                                                   Southwood S, Livingston BD, Chesnut R;

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                STRAIN=DSM 30040;
Daniel R., Gotteschalk G.;
Submitted (MAY-1994) to the EMBL/GenBank/DDBJ databases.
-!- FUNCTION: TRANSFERS A METHYLENE GROUP FROM S-ADENOSYL-L-METHIONINE
TO THE CIS DOUBLE BOND OF AN UNSATURATED FATTY ACID CHAIN
RESULTING IN THE REPLACEMENT OF THE DOUBLE BOND WITH A METHYLENE
BRIDGE (BY SIMILARITY).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                     CATALYTIC ACTIVITY: S-adenosyl-L-methionine + phospholipid olefinic fatty acid = S-adenosyl-L-homocysteine + phospholipid cyclopropane fatty acid.
SUBCELLULAR LOCATION: Cytoplasmic (By similarity).
                                                                                                                                                                                                                                         Bacteria; Proteobacteria, Gammaproteobacteria, Enterobacteriales,

ISSUE SPECIFICITY: Widely expressed. Found in the retina.
DISEASE: Defects in USH3A are the cause of Usher syndrome type 3 (USH3) [MIM:276902]. Usher syndrome is an autosomal recessive condition, characterized by the association of retinitis pigmentosa with sensorineural deafness. Patients with USH3 have progressive hearing loss, variably present vestibular dysfunction and adult onset retinitis pigmentosa. USH3 is a common form of USHar syndrome in Finland, where it accounts for 42% of all Usher
                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Joensuu T., Haemaelaeinen R., Yuan B., Johnson C., Tegelberg S., Gasparini P., Zelante L., Pirvola U., Pakarinen L., Lehesjoki A.-E., de la Chapelle A., Sankila E.-M.;

Gene 53:41-54(1987).

-!- FUNCTION SUBUNITS I, II AND III FORM THE FUNCTIONAL CORE OF THE ENZYBE COMPLEX (BY SIMILARITY).

-!- CATALYTIC ACTIVITY: 4 FERROCYTOCHROME C + O(2) = 4 FERRICYTOCHROME C + 2 H(2)O.

-!- SIMILARITY: BELONGS TO THE CYTOCHROME C OXIDASE SUBUNIT 3 FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                Cantatore P., Roberti M., Morisco P., Rainaldi G., Gadaleta M.N.,
